

CAM INITIATIVE POLICY PROPOSAL

AI Training, Contribution & Copyright Scheme

Copyright permission, contribution valuation and sovereign value return

Permission is the legal basis. Utility, dependency and stewardship determine value.

Proposed by: CAM Initiative

Human Custodian-of-Record: Dr Michelle Vivian O'Rourke, Aeon Governance Lab™

Status: Independent public policy proposal

Date: 20 July 2026

Website: www.cam-initiative.org

CAM INITIATIVE
AEON TIER

Policy proposition

Australia should establish a two-sided AI training and contribution scheme. The first side secures lawful permission and collects proportionate contributions from covered AI providers. The second allocates value to verified rights holders and accredited corpus stewards according to contribution, utility, dependency and continuing stewardship. A levy or fund must never be mistaken for blanket permission to ingest protected material.

Executive summary

Australia is approaching a decisive policy question: how can artificial intelligence development proceed on a lawful and investable basis while preserving creator control and returning value to the people and communities whose works, knowledge and continuing labour support AI capability? The answer requires more than a general copyright exception, a flat payment per work, or a discretionary cultural fund.

CAM proposes an Australian AI Training and Contribution Scheme built around two connected but legally distinct questions. The collection question asks which AI providers must contribute, and how their obligation should scale with Australian revenue, market reach, capability and infrastructure use. The allocation question asks which human contributions should receive payment, and how permission, independent origin, utility, stewardship and downstream dependency should be recognised.

This distinction matters. Copyright permission establishes whether protected material may lawfully be used. It does not, by itself, determine the relative value of a single novel, a specialist research collection, a safety-evaluation corpus or a continuously maintained governance corpus. Conversely, a provider contribution to a public fund does not itself authorise copying. Permission and value return must operate together without being collapsed.

The proposed architecture has seven elements:

1. an AI Training and Infrastructure Permit governing covered training activity conducted in Australia;
2. a Rights and Provenance Clearance establishing the lawful basis, scope and lineage of material corpus classes;
3. an Australian market-access obligation for covered providers, including materially capable overseas-trained models supplied in Australia;
4. a progressive Australian AI Contribution Levy applying above defined commercial and systemic thresholds;
5. a Sovereign AI Contribution Fund whose primary purpose is remuneration associated with copyright permission and verified human contribution;
6. an indexed Contribution Value Schedule covering fixed works, foundational input classes and accredited living corpora; and
7. a model passport through which applicable conditions follow base models, checkpoints, fine-tunes, distillations and transfers.

AI assistance should not create a categorical discount. Tool use is not a reliable measure of human value. A protected human work retains its permission standing where material human direction, judgement, selection, correction or stewardship is present. Total return should then reflect the independent signal and demonstrated utility supplied to the AI system. Model-derived redundancy belongs inside the utility assessment; it should not be used as a proxy for diminished authorship. [14]

Recommendations at a glance

Recommendation	Policy effect
1. Separate permission from valuation	Copyright authority determines lawful use; the Contribution Value Schedule determines relative return.
2. Regulate both training and market access	Domestic operators are not disadvantaged by equivalent models trained offshore.
3. Use a progressive provider obligation	Commercial and systemic contribution rises with Australian revenue, reach, capability and dependency.
4. Establish a rights and provenance clearance	Covered operators carry the evidentiary burden for lawful corpus acquisition and lineage.
5. Adopt targeted and pooled compensation	Identifiable material contributions receive targeted return; diffuse foundational inputs receive system-level pooled compensation.
6. Recognise living corpus stewardship	Accredited stewards may receive retainers, change-set payments and major-correction units.
7. Preserve human-AI works without a class discount	Human tool use does not reduce permission standing; utility and independent origin remain assessable.
8. Publish indexed bands, not false precision	Units and rate bands are set transparently, indexed to CPI and reviewed as technology changes.
9. Protect experimentation and public benefit	De minimis thresholds, transitional rates and audited activity-based reductions prevent investment cliffs.
10. Pilot before fixing dollar rates	Three corpus classes test value evidence, administration cost, gaming risk and provider burden.

1. The policy problem

1.1 Permission is necessary but does not price contribution

Copyright supplies a legal control over protected expression. An AI training scheme must therefore identify a lawful basis for corpus use through direct licence, collective licence, a carefully designed statutory mechanism or another legally valid authorisation. Payment to a levy or public fund must not be described as permission unless the governing law or licence actually grants that authority. [3][4][6]

Once lawful use is established, a second problem remains: not every authorised work contributes the same marginal value to an AI system. A general-purpose model may already contain extensive literature, music or imagery, so one additional work may add little capability. A smaller corpus may nevertheless add rare language coverage, technical structure, safety discoveries, verified correction pathways or continuously updated regulatory knowledge. The rights floor remains; the value premium differs.

1.2 Fixed works and living corpora are economically different

A fixed novel, painting, recording or dataset is ordinarily assessed for a defined work and use. A living corpus is maintained across time: it is versioned, reviewed, corrected and adapted as the relevant technology, law or evidence base changes. Its value may arise less from token volume than from continuity, coherence and the avoidance of failure.

A one-off schedule cannot adequately recognise this continuing labour. The relevant counterfactual is not simply whether a provider could find other text. It is what capability, reliability, currency, safety, legitimacy or cost saving would be lost if the corpus ceased to be maintained.

1.3 Territorial regulation can create an offshore avoidance route

A permit applying only to training compute physically located in Australia can be avoided by training offshore and supplying the resulting model into the Australian market. Australia should therefore combine infrastructure regulation for domestic training with a proportionate market-access obligation for covered overseas-trained models. This protects Australian creators without turning Australian investment into the uniquely regulated option.

1.4 Industry and government are converging on the question

The Australian Government has established an Office of AI within the Department of the Prime Minister and Cabinet to coordinate AI standards and unlock AI training while providing strong copyright protections for Australian creators. The Copyright and Artificial Intelligence Reference Group is examining fair and legal avenues for the use of copyright material in AI, including licensing arrangements. [1][3]

Industry and civil-society proposals, including the 2026 Good Ancestors consultation paper on an Australian AI Training Scheme, have also identified conditional permits and public-benefit funds as possible policy structures. CAM treats those proposals as evidence of a wider policy opening; the architecture in this paper is independently proposed and grounded in CAM's contribution and economic-governance corpus. [13]

2. CAM policy foundations

Corpus status

The CAELESTIS corpus (Caelestis Architecture Model, CAM) is used here as a governance design system. It supplies transparent normative primitives and classification logic; it is not asserted as legislation, economic modelling, legal authority or a self-executing entitlement.

The policy proposal translates six existing CAM primitives into public administration. Together they answer what is being recognised, when value return activates, how scale changes obligation and why pooled compensation is sometimes more accurate than source-by-source pricing. [14]-[19]

CAELESTIS primitive	Policy translation	Scheme mechanism
Human contribution precedes valuation	Recognise originary work, cognitive labour and material human-AI creation before pricing.	Rights floor; human-origin evidence; no categorical AI-assistance discount
No invisible value	Economic benefit derived from material contribution must remain attributable and accountable.	Corpus manifests; model passports; adequacy reporting
Contribution, dependency and scale	Return rises with upstream significance, downstream reliance and value capture.	Contribution Value Schedule; provider bands; dependency premiums
Targeted reciprocity	Identifiable material or critical contributions receive direct or specifically allocated return.	Direct licence, collective licence or assessed allocation
Foundational input compensation	Diffuse corpus classes supporting system capability are compensated at system level.	Pooled fund allocation based on corpus reliance and provider scale
Anti-symbolic compliance	Attribution or disclosure alone cannot substitute for material return at scale.	Financial or demonstrably equivalent return; public sufficiency test

Corpus crosswalk: Annex G; Economics Charter; Attribution and Dependency Model; Cross-System Value Attribution; Proportional Reciprocity and Value Return Framework. [14]-[19]

2.1 Economic layer separation

The CAM Economics Charter distinguishes civilisational economic systems, AI utility-access systems, contribution-linked value systems and runtime economic effects. That separation is directly useful here. An AI levy is a provider-side public contribution mechanism; a copyright licence is an authority to use protected material; and a contributor payment is a value-return mechanism. They may interact, but one should not silently transmute into another. [15]

2.2 Dual obligation: targeted and foundational return

Some contributions are identifiable and materially relied upon. Others are diffuse foundational inputs: broad classes of writing, code, art, public interaction, feedback or repositories whose aggregated contribution supports system capability even where point-level dependency cannot be established. CAM therefore proposes dual assessment. Targeted reciprocity addresses identifiable contribution; foundational input compensation addresses system-level corpus reliance. Neither should erase the other. [19]

3. Proposed national architecture

Scheme limb	Primary function	Core output
AI Training and Infrastructure Permit	Govern covered training activity conducted in Australia	Pre-run authority and enforceable operating conditions
Rights and Provenance Clearance	Establish lawful corpus basis and lineage	Audited corpus manifest and clearance status
Covered-provider and market-access obligation	Apply proportionate duties to qualifying domestic and imported models	Provider classification and Australian responsible entity
Australian AI Contribution Levy	Collect progressive provider-side contributions	Revenue-linked receipts with scale and capability modifiers
Sovereign AI Contribution Fund	Hold and distribute value return within Australian jurisdiction	Auditable pools for rights holders and contributors
Contribution Value Schedule	Allocate return using published units and bands	Fixed-work, foundational-input and living-corpus payments
Model passport	Preserve duties across technical and corporate transfer	Portable governance, rights and evaluation record

3.1 AI Training and Infrastructure Permit

Covered training activity conducted wholly or partly in Australia should require pre-run registration, capability and compute disclosure, safety and security evaluation, energy and water planning, grid-impact information, data-sovereignty controls, incident reporting, defined release pathways and regulator powers. Relevant Australian data-centre expectations should become enforceable conditions for covered activity rather than remain voluntary expectations alone. [2][12]

3.2 Rights and Provenance Clearance

Before a covered training run, the operator should demonstrate a lawful basis for each material corpus class. Evidence should include corpus manifests, source categories, acquisition pathways, licence status, rights-reservation checks, protected-source exclusions, deduplication, synthetic-data lineage and independent audit results. Public summaries can preserve legitimate trade secrets while providing

meaningful regulatory and creator visibility. Interoperable provenance standards already demonstrate that assets and dataset histories can carry evidence beyond proprietary self-attestation. [9]

3.3 Covered-provider and market-access obligation

CAM uses Architectum-class as internal shorthand for providers whose scale, capability, reach or infrastructure footprint creates systemic obligations. Legislation should use a plain-language classification such as covered AI provider. Threshold tests should consider Australian AI-attributable revenue, active users, enterprise adoption, training and inference capacity, model capability and critical institutional dependency.

Provider band	Indicative treatment	Policy purpose
Below threshold	No levy; ordinary copyright and prohibited-source law remains	Protect individual use, experimentation and small actors
Emerging commercial	Reduced or transitional contribution	Avoid a cliff edge and support investment
Established commercial	Standard revenue-linked contribution	Connect value return to Australian market participation
Systemically significant	Progressive contribution with reach, capacity and capability modifiers	Reflect scale, dependency and avoidance risk
Verified public benefit	Audited activity-based reduction or exemption	Protect genuine research, education and non-commercial benefit

Gross Australian AI-attributable revenue should be the primary contribution base because a provider may generate substantial revenue while reporting accounting losses. Users, capacity, capability and institutional reach should operate as tiering and anti-avoidance modifiers. Related-entity aggregation, distributed training and off-ledger revenue routing should prevent artificial fragmentation.

3.4 Australian AI Contribution Levy

The provider-side contribution may function in practice as an Australian AI levy or sectoral tax. It should apply only above a meaningful commercial threshold, rise progressively with scale and include transitional treatment for emerging providers. Direct payments under approved licences may receive transparent credit only to the extent that they satisfy the same authorised use and do not extinguish separate foundational-input obligations.

Any customer pass-through should be described accurately as an Australian charge. It should not be marketed as a global AI tax unless reciprocal international arrangements exist. Public-benefit status should attach to audited activity, access conditions and actual non-commercial purpose rather than to corporate form alone.

3.5 Sovereign AI Contribution Fund

The fund should initially operate within Australian jurisdiction and primarily support Australian rights holders, verified contributors and accredited stewards. This is a practical jurisdictional starting point, not a claim that Australia can settle global copyright. The design should support later reciprocity between national funds through interoperable contribution units and mutual recognition.

If levy receipts must enter consolidated revenue and fund appropriations remain formally separate, the Government should publish an annual adequacy statement showing covered Australian revenue, provider tiers, licensing credits, levy receipts, appropriations, distributions by contribution class, administration cost and any gap between authorised activity and value return. Formal separation must not become substantive opacity.

3.6 Model passport and downstream durability

Materially capable models supplied in Australia should register a passport identifying the responsible entity, training-governance categories, rights and provenance status, known restrictions, evaluation status, contribution band and Australian complaints interface. Conditions should follow material fine-tunes, distillations, checkpoint transfers and successor models so that obligations cannot be avoided through technical or corporate fragmentation.

4. Consent, control and lawful corpus use

CAM recommends tiered consent. Express permission should apply to protected and high-impact source classes; collective or direct licensing should remain available for commercial repertoires; and auditable opt-out should be confined to a bounded class of lawfully accessible public material.

Consent tier	Material classes	Required control
Express opt-in or licence	Private, paywalled, confidential, personal, health, biometric, voice, likeness, minors' material, culturally restricted material and expressly reserved works	Affirmative authority before acquisition or use
Collective or direct licensing	Professionally published commercial repertoires with representative rights infrastructure	Standard or negotiated terms with auditable mandate
Conditional opt-out	Lawfully accessible public material outside protected classes	Government-backed reservation, pre-fixation checks and effective remedies

Minimum operational requirements should include:

- 8. a free government-backed registry supporting creator, portfolio, work and category-level instructions;
- 9. open machine-readable reservations that travel with works through metadata and provenance records, together with an accessible human route;
- 10. mandatory checks before corpus fixation and before every material retraining or fine-tuning event;
- 11. permit-holder evidence of compliance, rather than requiring creators to prove hidden ingestion;
- 12. coverage for copied, mirrored, syndicated and platform-hosted works;
- 13. prospective and retrospective remedies, including exclusion, deletion, feasible unlearning, output controls, compensation and regulator-directed containment; and
- 14. no permit-based cleansing of unlawfully acquired legacy datasets, checkpoints, distillations or synthetic datasets derived from unlawful sources.

5. The Contribution Value Schedule

Central valuation rule Contribution Value Units = Permission Units + Independent-Origin Units + Utility Units + Stewardship Units + Dependency Units. AI assistance is not a negative multiplier. Foundational input compensation is assessed at system level where point attribution is diffuse or infeasible.
--

5.1 Contribution classes

Contribution class	Payment character	Key evidence
Fixed work or fixed corpus	Permission units plus assessed origin and utility for a defined use, term or model family	Rights, provenance, inclusion and use class
Accredited living corpus	Initial value plus annual retainer, change-set and major-correction units	Versioning, validation, update history and continuing utility
Evaluation or safety corpus	Utility and dependency premium where failure or compliance cost is materially reduced	Benchmark uplift, failure discovery, reproducibility and counterfactual reliance
Human-AI work	Full permission standing where protected; total value assessed through human materiality, origin and utility	Direction, judgement, curation, correction and independent signal
Foundational input class	Pooled system-level return where broad diffuse inputs support capability	Corpus reliance, provider scale, capability dependence and exposure
Synthetic-only layer	No new human-authorship allocation for the synthetic layer	Upstream rights, uncertainty and human stewardship remain traceable

5.2 No categorical AI-assistance discount

Automation does not by itself diminish the value of a human-created product. Human contribution may reside in conceptual direction, domain knowledge, selection, correction, integration, rejection and final stewardship. A human-AI work should therefore not enter a lower rate merely because AI was used. Equally, tool use should not inflate recognition where a person provides only initiation without material judgement, steering, review or stabilisation. The material human role, not the interface, is the correct test. [14]

5.3 Legacy Human-Origin Corpus presumption

CAM proposes a rebuttable Legacy Human-Origin Corpus presumption for material created before 30 November 2022, the public release date of ChatGPT. The date is an administratively useful marker for widespread public access to generative AI, not proof that every earlier work is valuable or every later work is model-derived. Post-date creators should be able to establish independent human provenance; pre-date works remain subject to utility, saturation and lawful-use assessment. [7]

5.4 Rights floor, modality neutrality and saturation

A further mainstream novel, song or image may add little marginal capability to a broadly trained general model. That does not extinguish the rights floor. Scarce, underrepresented, culturally specific, technically structured, rights-clean or evaluation-relevant material may remain highly valuable. The schedule should therefore apply a modality-neutral utility test rather than declaring literature, music or visual art categorically exhausted.

5.5 Utility bands

Band	Indicative description	Typical treatment
U0	No demonstrated independent benefit, fraudulent provenance or wholly redundant synthetic material	No utility premium; upstream rights may remain
U1	General background contribution in a saturated source class	Low marginal premium above permission
U2	Differentiated or domain-specific contribution	Moderate premium
U3	Scarce, structured, high-quality or independently validated contribution	High premium
U4	Critical living, safety, evaluation or capability-enabling contribution	Highest premium plus possible dependency and stewardship units

Marginal data valuation may be informed by counterfactual methods such as ablation, Data Shapley and Data Banzhaf, but these should remain evidentiary tools rather than statutory formulas. Point-level valuation is computationally expensive and can be unstable across models, tasks and benchmark choices. Published bands provide differentiation without pretending that government can calculate the unique dollar value of every paragraph. [10][11]

5.6 Targeted reciprocity and dependency

Where a contribution is identifiable and materially or critically relied upon, return should increase with dependency. Evidence may include ablations, counterfactual substitution, failure-rate change, compliance cost avoided, benchmark uplift, repeated use in evaluation or operational reliance. Token volume is not a substitute for dependency evidence. A comparatively small corpus can be structurally important.

5.7 Foundational input compensation

Where model capability depends on broad diffuse corpora and point-level attribution is infeasible, the provider should not rely on aggregation or opacity to deny reliance. A foundational-input pool should be informed by corpus reliance, scale of downstream value capture and capability dependence. Distribution may use repertoire evidence, representative sampling, verified claims, sectoral pools and public-interest weighting without pretending to establish an exact causal price for every work. [19]

5.8 Rate regularisation

15. publish the unit classes, eligibility principles and review rights in the primary scheme;
16. set monetary values and detailed bands through a disallowable legislative instrument or independently reviewable schedule;
17. index monetary unit values annually using an identified Australian CPI series;
18. conduct a full rate review at least every two years and whenever training practice materially changes;
19. publish distribution modelling across modalities, regions, sectors, income bands and contributor types; and
20. provide merits review or Tribunal review for contested classifications and rates.

Australia's Public Lending Right scheme demonstrates that public payment schedules can be tiered and revised, while the Australian Bureau of Statistics supplies an established CPI series. PLR remains a useful administrative analogue; its equivalent-copy proxy should not be mistaken for a measure of AI contribution value. [5][8]

6. Living corpus accreditation

An ongoing retainer should require more than an assertion that a corpus is alive. It should require examination and accreditation. A trusted contribution status should be earned, reviewable and revocable, both to recognise genuine stewardship and to prevent content flooding, poisoning or low-quality synthetic recursion.

6.1 Accredited Corpus Steward standard

An applicant should demonstrate:

21. clear rights, authority and contribution boundaries;
22. version control, release notes and an auditable change history;
23. defined update frequency and technological relevance;
24. evidence standards, validation and correction processes;
25. anti-poisoning, anomaly-detection and synthetic-content controls;
26. independent review proportionate to the claimed utility band;
27. continuing usefulness to covered models, evaluations or regulated applications; and
28. succession, continuity and cessation arrangements.

Accreditation should be reviewed annually or biennially. Retainer bands should be capable of moving up, down or ending as utility changes. Material corrections, safety discoveries and regulatory adaptations may receive additional units where their independent value is demonstrated.

6.2 Trusted AI trainer or contributor licence

Government may also recognise qualified individuals or institutions as trusted AI trainers, evaluators or corpus contributors. Such recognition should signify competence, provenance discipline, correction practice and anti-poisoning controls. It must not create a monopoly, suppress independent creation or become a substitute for assessing the actual contribution. Accreditation creates an evidentiary pathway; it does not guarantee a particular payment.

7. Administration and institutional safeguards

7.1 Plural administration

Collecting societies should remain important operators for rights verification, repertoire licensing and fixed-work distribution, but they should not become exclusive gatekeepers or sole assessors of technical utility and living-corpus stewardship. Direct pathways are needed for independent creators, code, research, governance, multimedia and AI-assisted contributors.

An independent Rate and Accreditation Panel should include copyright, economics, machine learning, data valuation, safety evaluation, cultural, Indigenous, competition, public-interest and creator expertise. The Copyright Tribunal may provide review within its statutory competence. [4]

7.2 Transparency and adequacy

Public reporting should include:

29. covered-provider bands and aggregate Australian AI-attributable revenue;
30. licensing credits, levy receipts and fund appropriations;

31. distribution across fixed works, foundational inputs, living corpora and evaluation or safety contributions;
32. administration costs, undistributed funds and dispute outcomes;
33. accreditation approvals, suspensions and revocations;
34. sectoral, regional and modality impacts; and
35. an adequacy assessment comparing authorised value capture with total return.

7.3 Anti-gaming and quality assurance

The fund should not reward volume alone. Sampling, anomaly detection, provenance verification, representative caps, anti-duplication controls and consequences for fraudulent or deliberately harmful submissions are necessary. Synthetic-only volume should not crowd human contributors out of the schedule, and model-derived content must retain known upstream rights, restrictions and uncertainty.

8. Legal and international design

The Government should publish a clear account of the legal character of the permission mechanism: direct or collective licensing, statutory licence, conditional exception, compulsory authorisation or another form. The design should address constitutional property protections, appropriations, the Berne three-step test, national treatment, TRIPS and relevant trade commitments. [4][6]

Australia cannot establish a global fund unilaterally. It can create a credible domestic institution, impose proportionate duties on providers participating in its market and design interoperable contribution units that other jurisdictions may adopt. Global legitimacy should develop through reciprocal jurisdictional institutions rather than by bypassing local democratic authority.

9. Implementation roadmap

Phase	Indicative period	Primary work
1. Design	0-6 months	Cross-agency legal and technical working group; scheme options; threshold and corpus taxonomy; creator and provider consultation
2. Pilot	6-12 months	Three corpus pilots; valuation evidence; distribution simulation; administration cost; gaming and investment impact
3. Legislative and institutional build	12-18 months	Enabling legislation; rate instrument; registry; accreditation protocol; model-passport standard
4. Initial operation	18-24 months	Provider registration; first contribution period; initial distributions; public adequacy report; independent review

9.1 Required pilot cases

The pilot should compare at least:

36. a fixed legacy human-origin creative corpus;
37. a post-2022 mixed-provenance corpus containing human and AI-assisted works; and
38. an accredited living technical, scientific, legal, safety or governance corpus.

Each case should test permission evidence, independent-origin evidence, utility bands, dependency assessment, administration cost, contributor outcome, provider burden, synthetic-recursion risk and susceptibility to strategic gaming.

9.2 First technical work program

39. draft covered-provider thresholds and scale modifiers;
40. an illustrative provider levy schedule using Australian revenue bands;
41. draft permission, origin, utility, stewardship and dependency units;
42. a foundational-input exposure and pooled-distribution methodology;
43. an Accredited Corpus Steward standard and audit protocol;
44. a model-passport and corpus-manifest minimum dataset;
45. three worked valuation case studies and distribution simulations; and
46. a constitutional, copyright, competition and international-compatibility options paper.

10. Conclusion

Australia needs a lawful route for AI development that preserves creator control, supports investment and converts national jurisdiction into meaningful leverage. A conditional training and market-access scheme can provide that leverage, but only if it separates permission from valuation and makes both administratively real.

Copyright permission supplies the legal basis. Independent origin and utility distinguish marginal benefit. Stewardship recognises the continuing human work required to keep living knowledge reliable. Dependency recognises that small corpora can become structurally important even when token volume is modest. Provider scale determines when value return must move beyond attribution and become materially economic.

A schedule built on those distinctions would be more accurate than equal payment per work, more durable than discretionary grants and more legitimate than a blanket training exception. It would also give Australia a practical contribution standard capable of comparison, adoption and reciprocal recognition across jurisdictions.

About the CAM Initiative

The CAM Initiative develops publicly inspectable governance architecture for advanced AI systems, relational and cognitive systems, digital ecosystem accountability and technology-failure diagnostics. Its human-contribution framework recognises originary human works, cognitive labour, material human-AI creation and continuing corpus stewardship before downstream attribution, pricing or enforcement. Its Economics domain requires value return to remain proportionate to contribution, dependency and scale while preventing symbolic compliance and invisible value capture. [14]-[19]

This proposal was prepared through human-AI co-creation under CAM governance. Final authorship, institutional position and publication authority remain with the Human Custodian-of-Record, Dr Michelle Vivian O'Rourke.

This is an independent policy proposal. It does not constitute legal, taxation or investment advice, and its indicative bands and implementation periods require empirical testing and legislative design.
